MANN-FILTER Flexline

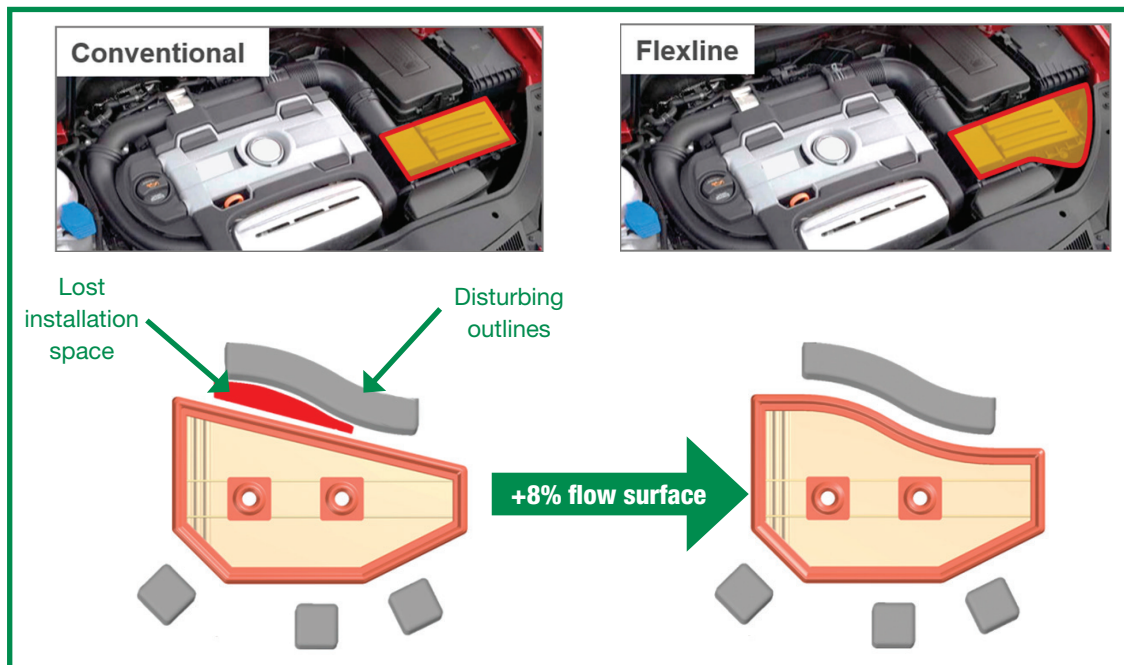

New air filters with flexible external contours that make more efficient use of the available installation space

Under the bonnet of a modern car, installation space is a rarity. Electronics, new technical components and safety technology have significantly reduced the available space. In response to this, MANN+HUMMEL has developed **Flexline: the state-of-the-art technology to utilise complex installation spaces**. Due to the curved geometry and flexible external contours of Flexline, lost installation space can now be utilised.

MANN+HUMMEL uses state-of-the-art laser technology to create almost any shape - this was not possible with traditional air filters. Flexline accommodates a larger filtration area compared with conventional designs and therefore achieves higher separation efficiency and dust holding capacity. Flexline air filters are also flatter than standard products, which means they can be used in particularly low installation spaces.

Flexline is currently available as MANN-FILTER C 26 017 and C 30 030 for the Mercedes-Benz A-Class for both petrol and diesel engines.

Flexible shape

results in a larger filtration surface area

Low pressure loss

thanks to increased flow surface

Improved acoustics

Extended lifetime
